Table S1

Table S1. Generation of HIV-1 isolates from plasma and peripheral blood mononuclear cells of 10 prospectively sampled individuals

Subject[1]	Number of TF viruses[2]	Date[3]	DFOSx[4]	Viral load (copies/ml)	CD4 count (cells/µl)	Number of SGA derived viral sequences (plasma)[5]	Number of SGA derived viral sequences (PBMC)[6]	Number of limiting dilution isolates (plasma)[7]	Number of bulk isolates (plasma)[8]	Number of outgrowth viruses (PBMC)[9]

		5-Jul-94 ‡	1,492		1					

[1] All subjects were men-who-have-sex-with-men (MSM) from the United Kingdom (MM) and the United States (WEAU), who were diagnosed with symptomatic primary subtype B infection and longitudinally followed before and after (shading) antiretroviral therapy.

[2] The number of transmitted founder (TF) viruses was inferred as previously described (Keele BF, et al,. PNAS, 2008) from single genome amplification (SGA) derived viral sequences from the first available plasma sample (Fig. S1); subjects MM14, MM23 amd MM33 were superinfected (SI) with additional subtype B strains at the timepoints indicated.

[3] Visit date; grey shading indicates time on suppressive antiretroviral therapy; subject WEAU received AZT monotherapy, which did not reduce viral loads (indicated by ‡).

[4] Days following onset of symptoms (DFOSx).

[5] Number of SGA derived 3' half genome or Env sequences amplified directly from plasma (Genbank accession number are listed in Table S 5); Env sequences for subjects MM39 and WEAU that have previously been reported (MM39, Wagh K, et al,. Cell Reports, 2018; WEAU, Wei X, et al,. Nature, 2003; Jones NA, et al,. JEM, 2004; Keele BF, et al,. PNAS, 2008; Salazar-Gonzalez J, et al,. JEM, 2009) are indicated by asterisks.

[6] Number of SGA derived 3' half genome or Env sequences amplified directly from peripheral blood mononucler cells (PBMCs) (Genbank accession number sre listed in Table S 5).

[7] Number of limiting dilution derived plasma isolates; all isolates were confirmed to be single virion derived by sequence analysis (Genbank accession number are listed in Table S 5).

[8] Number of conventional (bulk) plasma isolates; most isolates were sequenced and those that represent single virion derived strains are shown in parentheses (Genbank accession number are listed in Table S5).

[9] Number of limiting dilution derived outgrowth viruses from peripheral blood mononuclear cells (PBMCs); all isolates were confirmed to be single virion derived by sequence analysis (Genbank accession number are listed in Table S 5).

Table S

Table S2. Phenotypic analysis of virus isolates

Isolate ID[1]	Sequence ID[2]	DFOSx[3]	Replicative capacity (ng p24/ml)[4]	Tropism[5]	IFNα2 IC50 (pg/ml)[6]	IFNβ IC50 (pg/ml)[6]

[1] Virus isolate identification
[2] Virus isolates sequence identification
[3] Days following onset of symptoms
[4] P24 protein concentration in the supernatant at day 7 post infection in the absence of IFN treatment was measured by ELISA
[5] TZMbl cell line was pretreated using AMD and Maraviroc drug to inhibit virus interaction with X4 and R5 cellular coreceptors, respectively.
[6] Concentration of IFN necessary to suppress viral replication by 50% compared to untreated.
[7] Average of multiple biological replicates IC50 results

[1]All subjects were recruited in the US and had subtype B infections, except for subject A09 who also had a subtype A strain (only subtype B viruses were isolated)

[2]M, male; F, female.

[3]ATI, analytical treatment interruption

[4]QVOA, quantitative viral outgrowth assay

[5]Viral isolates were confirmed by sequence analysis to be single virion-derived (Genbank accession number are shown in Table S X)

[1]Isolates were obtained by expanding viral outgrowth assay (VOA) supernatants as previously reported (Lorenzi et al., 2016; Bar et al., 2016; Salantes et al., 2018; and Mendoza et al., 2018) or generated de novo from cryopreserved PBMCs or plasma samples.

[2]Viral sequence identifier as submitted to GenBank (for accession numbers see Table S5).

[3]Concentration of p24 antigen in CD4+ T-cell culture at day 7 postinfection in the absence of IFN treatment.

[4]Viral tropism as determined in TZMbl cells; cells were pretreated with AMD and Maraviroc prior to virus infection to inhibit interaction with CXCR4 and CCR5 cellular receptors, respectively.

[5]Dose of IFN that reduced viral replication in CD4+ T cells by 50%.

[6]Concentration of soluble CD4 (sCD4) that reduced infectivity by 50% in a TZMbl neutralization assay.

[7]Concentration of CD4-Ig that reduced infectivity by 50% in a TZMbl neutralization assay.

[8]Infectious units per particle (picogram of RT) measured in TZM-bl cells.

[9]Percent of viral release from CD4+ T cells 7 days after infection, expressed as the ratio of cell-free p24 and cell-associated plus cell free p24.

[10]Samples from the NCT02825797 study were collected before (-2 week) and during (12 week) treatment interruption, but prior to any detectable rebound virus.

[11]B106.1.C.3.8 was isolated from the first and 106.2.C.D6.S8 from the second leukapheresis sample.

[12]Infectious molecular clones (IMCs) 9242.REB.r1 and 601.REB.r1 were synthesized based on the consensus sequences of four closely related rebound isolates, including 9242.REB.6A7, 9242.REB.6B2, 9242.REB.13B1 and 9242.REB.13B8 as well as 601.REB.4B4, 601.REB.4A8, 601.REB.4A7 and 601.REB.4C1, respectively.

Table S5

Table S5. Virus replication in macrophages from different donors.

*Using CD14 selection, moncytes were isolates from peripheral blood mononuclear cells of 8 healthy donors, and cultured in M-CSF containing media to allow differentiation into macrophages. Virus replication was monitored for 20 days by measuring p24 antigen in culture supernatants. "yes" denotes p24 production above 0.5ng/ml.
